

3.3 BALANCED SEARCH TREES

- 2-3 search trees
- red-black BSTs
- B-trees (see book or videos)

Symbol table review

implementation	guarantee			average case			ordered	key
	search	insert	delete	search	insert	delete	ops?	interface
sequential search (unordered list)	n	n	n	n	n	n		equals()
binary search (ordered array)	$\log n$	n	n	log n	n	n	•	compareTo()
BST	n	n	n	log n	$\log n$	\sqrt{n}	•	compareTo()
goal	$\log n$	$\log n$	log n	log n	log n	$\log n$	~	compareTo()

Challenge. Guarantee performance.

optimized for teaching and coding; introduced to the world in COS 226!

This lecture. 2-3 trees and left-leaning red-black BSTs.

3.3 BALANCED SEARCH TREES

- ▶ 2-3 search trees
- red-black BSTs
- B-trees

Algorithms

ROBERT SEDGEWICK | KEVIN WAYNE

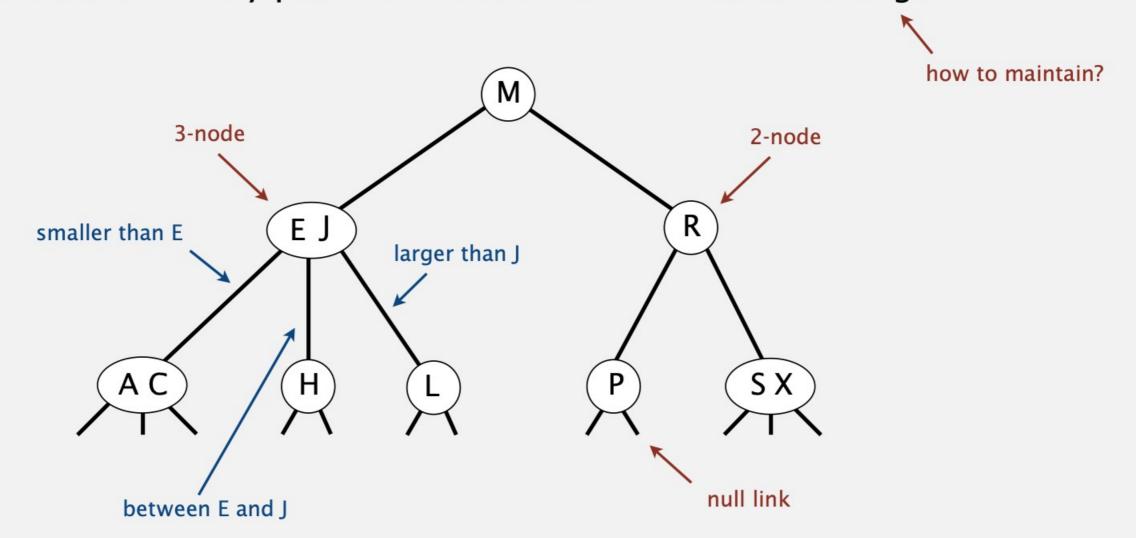

https://algs4.cs.princeton.edu

2-3 tree

Allow 1 or 2 keys per node.

- 2-node: one key, two children.
- 3-node: two keys, three children.

Symmetric order. Inorder traversal yields keys in ascending order. Perfect balance. Every path from root to null link has same length.

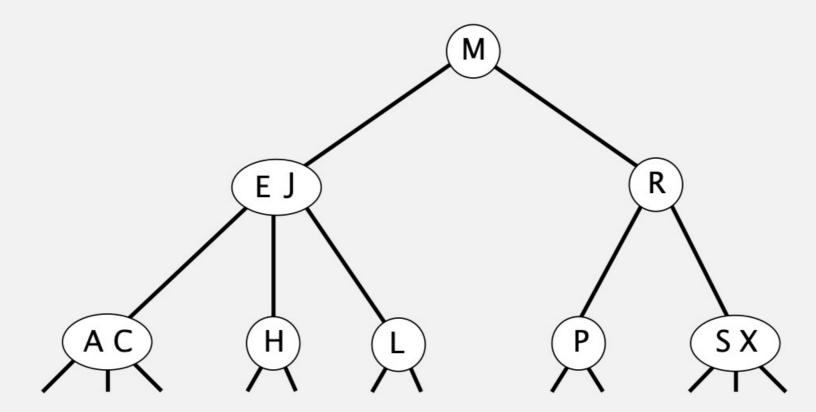

2-3 tree demo

Search.

- Compare search key against key(s) in node.
- Find interval containing search key.
- · Follow associated link (recursively).

search for H

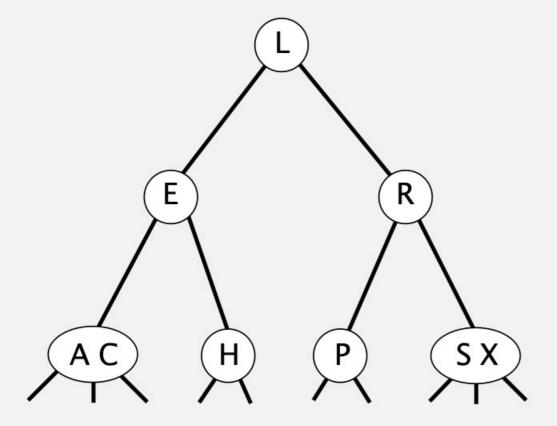

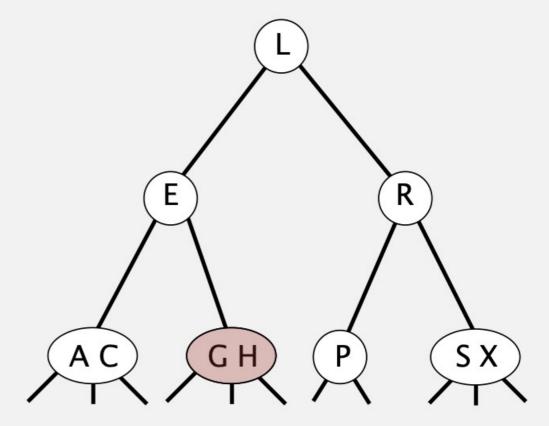

2-3 tree: insertion

Insertion into a 2-node at bottom.

Add new key to 2-node to create a 3-node.

insert G

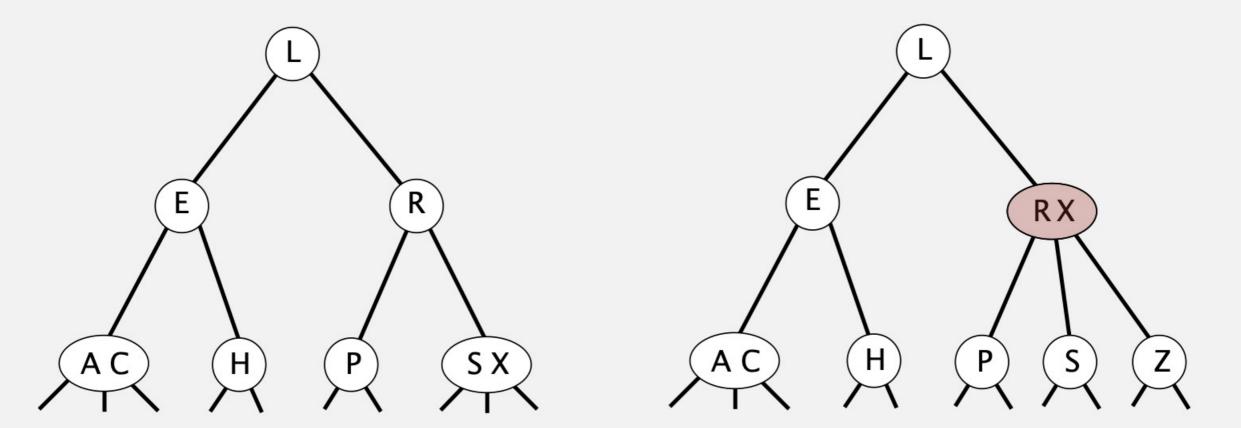

2-3 tree: insertion

Insertion into a 3-node at bottom.

- Add new key to 3-node to create temporary 4-node.
- Move middle key in 4-node into parent.
- Repeat up the tree, as necessary.
- If you reach the root and it's a 4-node, split it into three 2-nodes.

insert Z

2-3 tree construction demo

Balanced search trees: quiz 2

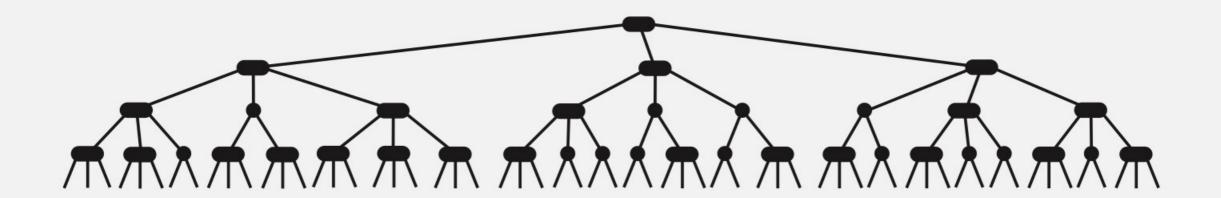

What is the maximum height of a 2-3 tree with n keys?

- A. $\sim \log_3 n$
- B. $\sim \log_2 n$
- C. $\sim 2 \log_2 n$
- $\sim n$

2-3 tree: performance

Perfect balance. Every path from root to null link has same length.

Tree height.

• Min: $\log_3 n \approx 0.631 \log_2 n$. [all 3-nodes]

• Max: $log_2 n$. [all 2-nodes]

- Between 12 and 20 for a million nodes.
- Between 18 and 30 for a billion nodes.

Bottom line. Guaranteed logarithmic performance for search and insert.

ST implementations: summary

guarantee			average case			ordered	key
search	insert	delete	search	insert	delete	ops?	interface
n	n	n	n	n	n		equals()
$\log n$	n	n	log n	n	n	~	compareTo()
n	n	n	log n	$\log n$	\sqrt{n}	~	compareTo()
$\log n$	$\log n$	log n	log n	log n	log n	~	compareTo()
	search n log n log n	search insert n log n n log n log n log n	search insert delete n n n log n n n n n log n log n	searchinsertdeletesearch n n n $\log n$ n $\log n$ n n $\log n$ $\log n$ $\log n$ $\log n$	searchinsertdeletesearchinsert n n n n $\log n$ n $\log n$ n n n $\log n$ $\log n$	searchinsertdeletesearchinsertdelete n n n n n n $\log n$ n $\log n$	searchinsertdeletesearchinsertdelete n n n n n $\log n$ n n n n n n $\log n$

but hidden constant c is large (depends upon implementation)

2-3 tree: implementation?

Direct implementation is complicated, because:

- Maintaining multiple node types is cumbersome.
- Need multiple compares to move down tree.
- Need to move back up the tree to split 4-nodes.
- Large number of cases for splitting.

fantasy code

```
public void put(Key key, Value val)
{
   Node x = root;
   while (x.getTheCorrectChild(key) != null)
   {
      x = x.getTheCorrectChildKey();
      if (x.is4Node()) x.split();
   }
   if (x.is2Node()) x.make3Node(key, val);
   else if (x.is3Node()) x.make4Node(key, val);
}
```

Bottom line. Could do it, but there's a better way.
